

## **CLEAN VERSION OF AMENDED CLAIM 1**

---

A |

1. A method of providing access to a communications network to a user supporting a mobile unit capable of wireless communication with at least one access node of a local area network that is capable of connecting to the communications network, comprising the steps of:
  - a) initially establishing wireless communication between the mobile unit and said at least one access node by associating the mobile unit with said at least one access node;
  - b) authenticating the user of the mobile unit at a server on the local area network to enable access to the communications network using a network address; and
  - c) establishing communication with a destination on the communications network, and recording at least some session particulars of a communications session in a centralized server by the network address on the communications network during which the mobile unit communicates with the destination.
